## **Compositions containing cis-isomers of a carotenoid compound and process**

The present invention relates to a primary composition that includes at least one carotenoid-containing material enriched in cis-isomers of the carotenoid compound, and  
5 process of forming the same. It also relates to an oral composition that contains the primary composition in a foodstuff, in a food supplement, in a cosmetic preparation or in a pharmaceutical preparation.

## **Background of the invention**

10 Compositions available on the market that include carotenoids, namely lycopene, are already known. Lycopene is a natural product which is known to have multiple roles, in particular that of an antioxidant that alleviates chronic diseases. Lycopene is present in various natural products, in particular tomatoes, melons, guavas  
15 and grapefruit. The composition generally available on the market which comprises lycopene is an oleoresin. The problem with this oleoresin is that the lycopene present therein is insufficiently bioavailable.

For example, European patent 278 284 relates to a pulverulent composition  
20 comprising a synthetic carotenoid. The problem with this composition is that it cannot be used in the food field and, moreover, it is envisaged for a coloring purpose.

Although EP 1 289 383 provides a primary composition that includes at least one lipophilic bioactive compound and a whey protein in an amount effective to  
25 increase the bioavailability of the lipophilic bioactive compound, there is still a need for a carotenoid-containing product which has higher bioavailability and bioefficacy than the products currently on the market. The carotenoid-containing composition must be better soluble in lipids, less prone to crystallization, and have a lower tendency to aggregate.

## **Summary of the invention**

NO 7792/EP

Accordingly, it is a first object of the invention to provide a primary composition comprising at least one carotenoid-containing material enriched in cis-isomers, the cis isomer content being in an amount effective to increase the bioavailability and/or bioefficacy of the carotenoid compound.

5

The carotenoid-containing material is an extract, concentrate or oleoresin advantageously obtained, extracted, enriched or purified from a plant or a vegetable material, microorganism, yeast or product of animal origin.

10

The preferred form of the primary composition is as an additive in a foodstuff for oral administration, such as in a nutritional composition, a food supplement, a pet food product, a cosmetic preparation or in a pharmaceutical preparation.

15

The invention also relates to methods of forming the primary composition, the food supplement, cosmetic preparation or pharmaceutical preparation containing the same.

20

The process for the preparation of a primary composition according to the present invention comprises subjecting a carotenoid-containing material as described above under conditions sufficient to increase its content in cis-isomers to an amount effective to increase the bioavailability and/or bioefficacy of the carotenoid compound in the primary composition.

25

In a further aspect, the invention provides the use of a primary composition comprising at least one carotenoid-containing material enriched in cis-isomers, for the preparation of an oral, cosmetic or pharmaceutical composition intended for improving skin health, in particular for photoprotection of the skin or for protecting skin tissue against ageing.

The invention also relates to the use of said primary composition for the preparation of an oral, cosmetic or pharmaceutical composition for preventing or treating cardiovascular diseases or cancers.

5           The present invention now makes available to the consumer an improved composition obtained from natural products. It provides a primary composition having a cis-isomer content of carotenoid higher than existing compositions. The primary composition provides carotenoids in a particularly highly bioavailable and/or bioeffective form, which is better soluble in lipids, less prone to crystallization, and  
10           having a lower tendency to aggregate.

The features of the present invention can be best understood together with further objects and advantages by reference to the following description, taken in connection with the accompanying drawings.

15

#### **Brief description of the drawings**

Fig. 1 shows a typical HPLC chromatogram of lycopene isomers generated by microwave irradiation, illustrating the products obtained by the process according to the  
20           present invention.

Fig. 2 outlines the advantage of microwave irradiation versus conventional heating.

25           Fig. 3 shows comparative HPLC chromatograms of lycopene isomers: (A) generated by microwave irradiation of tomato oleoresine; (B) generated by microwave irradiation and enriched by solvent fractionation.

30           Fig. 4 shows HPLC chromatograms of lycopene isomers: (A) generated by iodine catalysed photoisomerization of tomato oleoresine; (B) generated by iodine catalysed photoisomerization and enriched by solvent fractionation.

NO 7792/EP

Fig. 5 shows comparative HPLC chromatograms of lycopene isomers: (A) generated by heating of tomato oleoresine in ethyl acetate; (B) generated by heating of tomato oleoresine in ethyl acetate and enriched by solvent fractionation.

5

### Detailed description of the invention

According to the first object, a primary composition comprising a carotenoid-containing material enriched in cis-isomers of said carotenoid compound, is concerned.

10

In a preferred embodiment, the carotenoid-containing material is in the form of an extract, a concentrate or an oleoresin, for example. Within the following description, the term "oleoresin" is understood to mean a lipid extract of a carotenoid-containing material, which includes carotenoids, triglycerides, phospholipids, tocopherols, tocotrienols, phytosterols and other less significant compounds.

15

Advantageously, the carotenoid-containing material is an extract, concentrate or oleoresin, which is obtained, extracted, enriched or purified from a plant or vegetable material, a microorganism, a yeast or a product of animal origin. It is further subjected to a treatment to increase its cis-isomer content of carotenoid, as described below.

20

If the source of carotenoid is from plant origin, it may be vegetables, leaves, flowers, fruits and other parts of the plant. In a preferred embodiment, the source of carotenoids is from tomatoes (i.e., whole tomato, tomato extract, tomato flesh, tomato puree, tomato skin, with or without the seeds), carrots, peaches, apricots, oranges, melons, guavas, papayas, grapefruit, rosehips, soya, green tea, green coffee beans, spices such as ginger or others, grapes and cocoa, for example. Suitable plant or vegetable concentrates are obtainable e.g. by drying or freeze-drying the fresh-cut plants or vegetables or the respective roots, fruits or seeds thereof and then optionally grinding or granulating the dried material. Suitable methods of obtaining extracts of the above-mentioned plants or vegetables are known in the art. The plant or vegetable extracts are

25

30

NO 7792/EP

obtainable e.g. by extracting the fresh-cut or processed plants or vegetables or the respective roots, fruits or seeds thereof for example with water or with one or more food grade solvents or with a mixture of water and one or more food grade solvents. Preferably, the extrats and concentrates according to the present invention may be  
5 lipidic or aqueous. Since carotenoids are liposoluble, extraction with water will remove unwanted constituents which are water-soluble such as sugars, amino acids, soluble proteins, organic acids, for example.

If the carotenoid-containing material is obtained from microorganism, any  
10 microorganism that produces carotenoid may be used, in particular probiotic microorganism, such as lactic acid bacterium, for example. Also, the product of animal origin may be from salmon, shrimps, for example or a liver extract or a milk fraction. The term "milk fraction" is understood to mean any part of the milk.

15 In a most preferred embodiment, the carotenoid-containing material is an oleoresin. Suitable methods of obtaining oleoresins from the above-mentioned plants or vegetables are well known in the art. For example, oleoresin are obtained by lipidic extraction using a solvent compatible with the food business, cosmetics or pharmaceuticals. Oleoresins prepared by conventional methods have a content in  
20 carotenoid of about 0.05% to 50% by weight. Their content of all-trans isomer of carotenoids is usually higher than that of cis isomers, e.g. the ratio of cis-trans isomers of lycopene in a selected tomato oleoresin is about 7:93. Oleoresins are preferred starting material for obtaining the primary composition according to the present invention, because they contain other carotenoids or antioxidants such as Vitamine E,  
25 which also stabilize the composition. The activity and stability of the carotenoid compound in the oleoresin is improved, in particular during the isomerisation process and the yield of the cis-lycopene in the primary composition is also increased.

The carotenoid-containing material preferably includes carotenes and  
30 xanthophylls, such as lycopene, carotene, zeaxanthine, astaxanthine, beta-cryptoxanthin, capsanthine, canthaxanthine, lutein, phytofluene or phytoene, for example. Said

carotenoid compounds have been subjected to a treatment to increase the *cis*-isomer fraction in the primary composition.

Accordingly, it is a further object of the invention to provide a process for the preparation of such a primary composition comprising the step of subjecting a carotenoid-containing material as described above, under conditions sufficient to increase its content in *cis*-isomers of carotenoid to an amount effective to increase the bioavailability and/or bioefficacy of the carotenoid compound in the primary composition.

The process may be in the form of a thermal treatment, an electromagnetic irradiation or a radical reaction, for example.

In a most preferred embodiment, the carotenoid-containing material which is in the form of an extract, a concentrate or an oleoresin, is subjected to a microwave irradiation or to other treatments including non-thermal treatments. Conditions of the microwave irradiation depend on the quantity and quality of the material. If an oleoresin is used, the power and time are adjusted so that the temperature of the microwave oven is of at least 100°C, preferably from 100 to 180°C and most preferably from 115 to 140°C. If an aqueous extract is used, a medium adapted to microwave irradiation may be used. The aim of the medium is to solubilize or disperse carotenoids. The losses can be minimised when the isomerisation is performed under nitrogen in the presence of antioxidants and in the absence of light. The isomerisation yield may also be improved by adding exogenous lipids in the medium.

The isomers of carotenoid-containing compound generated thereof may be subjected to a further treatment intended to modify the isomer profile of the primary composition according to the intended use. The enrichment in some specific *cis*-isomers may be achieved by solubilisation of *cis*-isomers in selected organic solvents followed by phase separation using centrifugation or filtration, for example.

The *cis:trans* isomer ratio in the primary composition may then be increased up to at least 20:80, preferably between 20:80 to 95:5, more preferably from 30:70 to 90:10.

5 The present invention thus provides a primary composition, in the form of a powder, liquid or gel, comprising a carotenoid compound which has a better bioavailability and/or bioefficacy than the compound alone. Also, the primary composition may be in the form of a highly water-dispersible composition, if the powder form is chosen. In this instance, the powder is dispersible in water at ambient temperature. The primary composition also provides carotenoids in a particularly highly  
10 soluble form in lipids and organic solvents, less prone to crystallization, and having a lower tendency to aggregate.

According to the invention the primary composition may be used either alone or in association with other active compounds such as vitamin C, vitamin E (tocopherols  
15 and tocotrienols), carotenoids (carotenes, lycopene, lutein, zeaxanthine, beta-cryptoxanthine, etc ..) ubiquinones (e.g. CoQ<sub>10</sub>), catechins (e.g. epigallocatechin gallate), coffee extracts containing polyphenols and/or diterpenes (e.g. kawheol and cafestol), extracts of chicory, ginkgo biloba extracts, grape or grape seed extracts rich in proanthocyanidins, spice extracts (e.g. rosemary), soy extracts containing isoflavones  
20 and related phytoestrogens and other sources of flavonoids with antioxidant activity, fatty acids, e.g. n-3 fatty acids, phytosterols, prebiotic fibers, probiotic microorganisms, taurine, resveratrol, aminoacids, selenium and precursors of glutathione, or proteins, such as whey proteins, for example.

25 The composition additionally comprises one or more of emulsifiers, stabilizers and other additives. Use is made of emulsifiers compatible in the food field, such as phospholipids, for example lecithin; polyoxyethylene sorbitan mono- or tristearate, monolaurate, monopalmitate, mono- or trioleate; a mono- or diglyceride. Use may also be made of any type of stabilizer that is known in the food business, in cosmetics or in  
30 pharmaceuticals. Use is made, as additives, of flavorings, colorants and any other additive known in the food business, in cosmetics or in pharmaceuticals. These

emulsifiers, stabilizers and additives are added according to the final use of the primary composition.

5 According to a further object, the present invention relates to an oral composition comprising the primary composition described above in a foodstuff, in a food supplement, in a pet food product, in a cosmetic preparation or in a pharmaceutical preparation.

10 In a preferred embodiment, a food composition for human consumption is supplemented by the above primary composition. This composition may be a nutritional complete formula, a dairy product, a chilled or shelf stable beverage, a mineral water, a liquid drink, a soup, a dietary supplement, a meal replacement, a nutritional bar, a confectionery, a milk or a fermented milk product, a yogurt, a milk based powder, an enteral nutrition product, an infant formulae, an infant nutritional product, a cereal  
15 product or a fermented cereal based product, an ice-cream, a chocolate, coffee, a culinary product such as mayonnaise, tomato puree or salad dressings or a pet food.

In this case, the powder is dissolved in the above-mentioned foods or drinks so as to have a daily intake of between about 0.001 and 50 mg of carotenoid contained in  
20 the primary composition, for example such as lycopene. A daily intake of the order of about 5 to 20 mg per day is preferably envisaged.

The nutritional supplement for oral administration may be in capsules, gelatin capsules, soft capsules, tablets, sugar-coated tablets, pills, pastes or pastilles, gums, or  
25 drinkable solutions or emulsions, syrups or gels, with a dose of about 0.001 to 100% of the primary composition, which can then be taken directly with water or by any other known means. This supplement may also include a sweetener, a stabilizer, an additive, a flavoring or a colorant. A supplement for cosmetic purpose can additionally comprises a compound active with respect to the skin. Methods for preparing them are common  
30 knowledge.

In another embodiment, a pharmaceutical compositions can be administered for prophylactic and/or therapeutic treatments. In therapeutic applications, compositions are administered to a patient already suffering from a disease, as described herein under, in an amount sufficient to cure or at least partially arrest the symptoms of the disease and its complications. An amount adequate to accomplish this is defined as "a therapeutically effective dose". Amounts effective for this will depend on the severity of the disease and the weight and general state of the patient.

In prophylactic applications, compositions according to the invention are administered to a patient susceptible to or otherwise at risk of a particular disease. Such an amount is defined to be "a prophylactic effective dose". In this use, the precise amounts again depend on the patient's state of health and weight.

The compounds of the invention are preferably administered with a pharmaceutical acceptable carrier, the nature of the carrier differing with the mode of administration, for example parenteral, intravenous, oral and topical (including ophthalmic) routes. The desired formulation can be made using a variety of excipients including, for example, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharin cellulose, magnesium carbonate. This composition may be a tablet, a capsule, a pill, a solution, a suspension, a syrup, a dried oral supplement, a wet oral supplement, dry tube-feeding, wet tube-feeding etc..

Preferably, for humans the pharmaceutical composition according to the present invention comprises an amount of the primary composition as described above, for a daily administration, so that the carotenoid amount is from about 0.01 mg to 100 mg. When administered daily to pets, the carotenoid amount is from about 0.01 mg to 100 mg.

It will be appreciated that the skilled person will, based on his own knowledge select the appropriate components and galenic form to target the active compound to the tissue of interest, e.g. the skin, colon, stomach, kidney or liver, taking into account the

route of administration which may be by way of injection, topical application, intranasal administration, administration by implanted or transdermal sustained release systems, and the like.

5           The invention also relates to a cosmetic composition comprising the primary composition described above. It may be formulated in lotions, shampoos, creams, sun-screens, after-sun creams, anti-ageing creams and/or ointments, for example. In this case, the content of primary composition is between 10.sup.-10 and 10%. The cosmetic composition preferably comprises between 10.sup.-8 and 5% of carotenoid compound.  
10       This composition which can be used topically additionally comprises a fat or an oil which can be used in cosmetics, for example those mentioned in the CTFA work, Cosmetic Ingredients Handbook, Washington. It is also possible to add other cosmetically active ingredients. The composition additionally comprises a structuring agent and an emulsifier. Other excipients, colorants, fragrances or opacifiers can also be  
15       added to the composition. It will be appreciated that the present cosmetic products will contain a mixture of different ingredients known to the skilled person, ensuring a fast penetration of the objective substance into the skin and preventing degradation thereof during storage.

20           It will be understood that the concept of the present invention may likewise be applied as an adjuvant therapy assisting in presently used medications. Since the compounds of the present invention may easily be administered together with food material special clinical food may be applied containing a high amount of the objective substances. It will be clear that on reading the present specification together with the  
25       appending claims the skilled person will envisage a variety of different alternatives to the specific embodiments mentioned herein.

30           The present invention additionally relates to the use of the primary composition, or the oral composition or the cosmetic composition described above for the preparation of a composition intended to protect the tissues of the skin against ageing, in particular for inhibiting damage to the skin and/or mucous membranes by inhibiting collagenases

and enhancing the synthesis of collagen. In fact, the use of the primary composition as described above makes it possible to enhance the bioavailability of the carotenoid compound in the body and to slow down the ageing of the skin, for example. It may also be useful in the prevention or treatment of sensible, dry or reactive skins, or for  
5 improving skin density or firmness, for ameliorating skin photoprotection, for preventing or treating cardiovascular diseases or disorders and cancers. They have also particular benefits on hair and coat of pet animals, such as an improved hair or coat density, fiber diameter, color, oilness, glossyness and a help to prevent hair or coat loss.

10 The effect of a food supplementation in the primary composition according to the present invention, on skin of humans or pets, can be measured by using conventional methods including minimal erythema dose (MED), colorimetry, transepidermal water loss, DNA repair (e.g. p.53), measure of interleukines and  
15 proteoglycans production, or collagenase activity, barrier function or cell renewal or ultrasonic echography.

The following examples illustrate the invention in more detail without restricting the same thereto. All percentages are given by weight otherwise indicated.

## 20 Examples

### Example 1: Preparation of the primary composition

25 g of lycopene oleoresin manufactured by LycoRed Natural Products  
25 Industries, Ltd. in Israel, are subjected to a microwave treatment of 150 sec. at 2.45 GHz at a temperature of about 105°C. The primary composition thus obtained is cooled down under nitrogen to prevent carotenoid degradation. The ratio of *cis:trans* isomer for lycopene is about 65:35 in the resulting composition.

30 **Example 2: Determination of lycopene isomerisation and degradation in processed tomato oleoresin**

The isomerisation yield and degradation of a tomato oleoresin from LycoRed Natural Products Industries, Ltd. in Israel, which has been treated by conventional heating (oil bath) or microwave is measured.

5

For this, tomato oleoresin (Lycored 6%) in glass vials was irradiated in a microwave oven (2.45 GHz) for various periods of time up to 150 s. At the end of each exposure period the temperature was measured in the oleoresin sample. After cooling, the samples were dissolved in n-hexane (containing 200 ppm BHT) and analysed by HPLC for isomer formation. Additionally, tomato oleoresins in glass vials were heated in an oil bath to the same temperatures as those previously measured at the end of the microwave treatments. They were removed immediately from the oil bath, left for cooling and analysed in the same way as the microwave irradiated samples. The HPLC method for lycopene isomer determination was adapted from Schierle et al. (1997) Food Chem. 59, 459-65.

10

15

The results are illustrated in Figures 1 and 2. Fig. 1 shows that predominantly 9- and 13-*cis* isomers of lycopene were generated by microwave irradiation, beside some other unidentified isomers and remaining all-*trans* lycopene. Fig.2 shows that lycopene isomerisation is stronger in the microwave treated oleoresin and the temperatures needed to generate *cis* isomers were lower compared to the conventionally heated samples.

20

In conclusion microwave is a very efficient method to generate geometrical isomers of lycopene.

25

### **Example 3: Determination of lycopene isomerisation in processed and fractionated tomato oleoresin**

The profile of lycopene isomers in a tomato oleoresin from Indena, spa., is determined by HPLC as in Example 2, to compare the following treatments :

30

NO 7792/EP

- isomerisation of lycopene by microwave treatment of 2 g oleoresin (Indena, 10%) at 2.45 GHz for 90 s (fig. 3A) followed by resuspension in ethanol, centrifugation (13'000 x g, 5 min, ambient temperature), rejection of the solid fraction and evaporation of the solvent under reduced pressure (fig. 3B)

5

- generation of lycopene isomers by iodine catalysed photoisomerisation (1h50) of 2 g oleoresin (Indena 10%) in CH<sub>2</sub>Cl<sub>2</sub> (fig 4A), followed by evaporation of CH<sub>2</sub>Cl<sub>2</sub>, resuspension in ethanol, centrifugation (13'000 x g, 5 min, ambient temperature) and rejection of the supernatant (fig. 4B)

10

- isomerisation of lycopene by refluxing 0.28 g of oleoresin (Indena 10%) in 30 mL of ethyl acetate for 1h (fig 5A), followed by evaporation of ethyl acetate, resuspension in ethanol, centrifugation (13'000 x g, 5 min, ambient temperature), rejection of the solid fraction and evaporation of the solvent under reduced pressure (fig 5B)

15

#### Results

Fig 3A shows that MW treatment of tomato oleoresin induced the formation of a broad range of lycopene *cis*-isomers. Fig 3B shows that solvent fractionation specifically increases *cis* to *trans* isomer ratio in MW treated tomato oleoresin

20

Fig. 4A shows that predominantly the 5-*cis* isomer is formed during photoisomerisation of tomato oleoresin. Fig. 4B shows that almost exclusively the all-*trans* and the 5-*cis* isomers are recovered in the insoluble fraction after phase separation.

Fig 5A shows that the 13-*cis* isomer is predominantly formed during short time refluxing tomato oleoresin in ethyl acetate. Fig. 5B shows that mainly the 13-*cis* isomer is retained in the soluble fraction after phase separation.

25

#### Example 4: Cosmetic for oral administration

A composition in the form of a hard capsule has the following formulation:

Compound	mg per capsule
primary composition of example 1	250

NO 7792/EP

<b>Excipient for the coating core</b>	
Microcrystalline cellulose	70
Encompress TM	60
Magnesium stearate	3
Anhydrous colloidal silica	1
<b>Coating agent</b>	
Gum-lac	5
Talc	61
Sucrose	250
Polyvidone	6
Titanium dioxide	0.3
Coloring agent	5

The composition can be administered to the individual in an amount of 2 to 3 capsules daily.

## Claims

1. A primary composition comprising at least one carotenoid-containing material, enriched in *cis*-isomers of the carotenoid compound.  
5
2. The primary composition according to claim 1, wherein the carotenoid-containing material is obtained, extracted or purified from a plant or vegetable material, microorganism, yeast or product of animal origin.
- 10 3. The primary composition according to claim 1 or 2, wherein the carotenoid-containing material is in the form of an extract, a concentrate or an oleoresin.
4. The primary composition according to one of claims 1 to 3, in which the *cis*-isomers of the carotenoid compound are in an amount effective to increase the  
15 bioavailability and/or bioefficacy of said carotenoid compound.
5. The primary composition according to one of claims 1 to 4, wherein the plant or vegetable material is tomatoes, carrots, peaches, apricots, oranges, melons, guavas, papayas, grapefruit, rosehips, soya, green tea, green coffee beans, spices, grapes or  
20 cocoa.
6. The primary composition according to one of claims 1 to 5, wherein the carotenoid compound is lycopene, carotenes, zeaxanthine, astaxanthine,  $\beta$ -cryptoxanthin, capsanthine, canthaxanthine, lutein, phytofluene or phytoene.  
25
7. The primary composition according to one of claims 1 to 6, in which the *cis:trans* isomers ratio of the carotenoid compound is of at least 20:80.
8. The primary composition according to one of claims 1 to 7, which is in liquid,  
30 gel or powder form.

9. An oral composition comprising the primary composition according to one of claims 1 to 8, in a foodstuff, in a food supplement, in a pet food product, in a cosmetic preparation or in a pharmaceutical preparation.

5 10. The oral composition according to claim 9, wherein the foodstuff is chosen from the group consisting of a nutritional complete formula, a dairy product, a chilled or shelf stable beverage, a mineral water, a liquid drink, a soup, a dietary supplement, a meal replacement, a nutritional bar, a confectionery product, a milk or a fermented milk product, a yogurt, a milk based powder, an enteral nutrition product, an infant formulae,  
10 an infant nutritional product, a cereal product or a fermented cereal based product, an ice-cream, a chocolate, coffee, a culinary product or a pet food product.

11. The oral composition according to claim 9 or 10, wherein the food supplement is provided in the form of capsules, gelatin capsules, soft capsules, tablets, sugar-coated  
15 tablets, pills, pastes or pastilles, gums, drinkable solutions or emulsions, syrups or gels.

12. The oral composition according to claim 11, which further comprises at least one of a sweetener, a stabilizer, a flavoring and a colorant.

20 13. The oral composition according to claim 9, wherein the cosmetic preparation additionally comprises a compound active with respect to the skin.

14. The oral composition according to one of claims 9 to 13, wherein the content of the primary composition is between about 0.001 and 100%, and preferably between  
25 about 10 and 50%.

15. A cosmetic composition comprising the primary composition according to one of claims 1 to 8.

30 16. The cosmetic composition according to claim 15, wherein the content of primary composition is between about 10.sup.-10% and 10%.

- 5 17. A process for the preparation of a primary composition according to claim 1 to 8, which comprises subjecting the carotenoid-containing material to a treatment under conditions sufficient to increase its content in *cis*-isomers of the carotenoid compound.
18. The process according to claim 17, wherein the *cis*-isomer content is an amount effective to increase the bioavailability and bioefficacy of said carotenoid compound.
- 10 19. The process according to claim 18, wherein the treatment is a thermal treatment, an electromagnetic irradiation or a radical reaction.
20. The process according to claim 19, wherein the primary composition is further subjected to a treatment to modify its isomer profile.
- 15 21. The process according to claim 20, in which the treatment is a solubilisation of *cis*-isomers in selected organic solvents followed by phase separation using centrifugation or filtration.
- 20 22. Use of a primary composition comprising at least one carotenoid-containing material enriched in *cis*-isomers, for the preparation of an oral, cosmetic or pharmaceutical composition for improving skin health.
- 25 23. The use according to claim 22, for protecting the tissues of the skin against ageing, in the prevention or treatment of sensible, dry or reactive skins, or for improving skin density or firmness, for increasing skin photoprotection.
- 30 24. Use of a primary composition comprising at least one carotenoid-containing material enriched in *cis*-isomers, for the preparation of an oral, cosmetic or pharmaceutical composition for preventing or treating cardiovascular diseases or cancers.

**Abstract****Compositions containing *cis*-isomers of a carotenoid compound and process**

- 5 The present invention relates to a primary composition that includes at least one carotenoid-containing extract, concentrate or oleoresin enriched in *cis*-isomers of the carotenoid compound, and process of forming the same. It also relates to an oral composition that contains the primary composition in a foodstuff, in a food supplement, in a cosmetic preparation or in a pharmaceutical preparation.
